What is the Internet of People?

The Internet of People adds its own blockchain, token and governance tools to Libertaria technology to create the first true global decentralized society.

Our fully decentralized and private person-to-person communications technology allows you to communicate, do business and use familiar apps, cutting out all middlemen and anyone who wants to control, censor or steal your data.
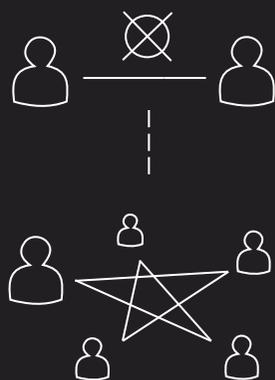

If that sounds like the Internet you want, then why not join us?

Middleman-Server
e.g. Facebook, Airbnb
Wigly, Uber
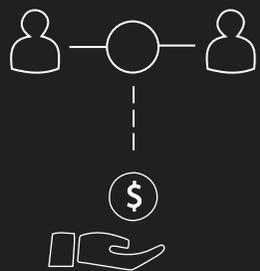

Person-to-Person
No middlemen!

Middleman's pocket

An Internet of People. Liberated.

The internet was supposed to usher in endless opportunities and freedoms, allowing people to connect, communicate and trade with anyone, anywhere.

But twenty years on, the dream has failed to materialize. A handful of technology companies control how we access the internet and what we see once we're online. Social media giants harvest our data for sale to the highest bidder. Governments decide what we can and cannot do and track our every move online.

It's time to take back the internet.

What is Libertaria?

Libertaria is creating technology for a decentralized world. Our cutting-edge software and hardware allow people to connect and transact directly, safely and privately while keeping full control of their data. We're developing tools to connect communities and create local economies, providing an alternative for people seeking a fairer, more decentralized, freer world.

Libertaria is the only project building the whole decentralization stack. Everything from our innovative Mercury peer-to-peer network, communications and dApps layer to Hydra, a new type of blockchain protocol. Our TitaniaOS gives everyone easy access to a plug-and-play network node for safe and private access to the network.

Libertaria is open source and free for everyone to use. We particularly invite like-minded projects to use our protocols and techstack and develop new dApps for TitaniaOS.
