Libertaria

TITANIA

and where you fit in.

What is Titania?

Titania is Libertaria's unique operating system, bringing blockchain, cryptocurrency and decentralized apps to everyone. No centralized servers, no censorship and no-one harvesting your data.

Specially optimized for lower power devices and even smartphones, Titania is creating the first global decentralized network truly accessible to everyone. The users themselves help support the network, getting rewarded for providing storage and other functions.

The Titania Box is your gateway to the free, private, decentralized internet. Fully secure, yet simple enough for anyone to set up in under ten minutes. Simply plug it into your router, follow the short instructions and you'll be connected right away.

Where do you fit in?

Universal: TitaniaOS brings true decentralization to everyone, everywhere.

Simple: Join the Libertaria decentralized network in just a few clicks.

Secure: Virtualized environment protects against hacks and human error.

Resource Efficient: Works anywhere, letting you repurpose old, unwanted or low-power devices.

Flexible: Crypto and decentralized apps on your computer, smartphone or TV.

The Libertaria Movement

Libertaria is creating technology for a decentralized world. Our cutting-edge software and hardware allow people to connect and transact directly, safely and privately while keeping full control of their data. We're developing tools to connect communities and create local economies, providing an alternative for people seeking a fairer, more decentralized, freer world.

Libertaria is the only project building the whole decentralization stack. Everything from our innovative Mercury peer-to-peer network, communications and dApps layer to Hydra, a new type of blockchain protocol. Our TitaniaOS gives everyone easy access to a plug-and-play network node for safe and private access to the network.

Libertaria is open source and free for everyone to use. We particularly invite like-minded projects to use our protocols and techstack and develop new dApps for TitaniaOS.

HYDRA
What is Hydra?

Hydra is a new approach to blockchain: a federated network of distinct blockchains all secured by a parent chain. Communities can set up their own economies and tokens on their own blockchain, all in a few mouse clicks. The parent chain secures all the child chains, combining the power of all the nodes in the network. The parent chain can also be used to exchange value between different child chains in atomic swaps, but because these child chains represent local economies, most transactions stay on the individual chains.

Now any community can have run their own blockchain, getting all the efficiency benefits of keeping things local, while keeping the security and stability of a global system.

Where do you fit in?

Create your own blockchain: Use Hydra's Genesis templates to create your own blockchain in just a few clicks.

Create your own token: Create your own cryptocurrency, secured with the consensus protocol of your choice.

Create your own community: Hydra provides governance, voting, smart contracts and more.

Fully scalable: Hydra scales globally while keeping most data and services local.

Fully secure: Written in Rust to prevent memory and overflow issues.

MERCURY

and where you fit in.

What is Mercury?

Mercury is a revolutionary person-to-person communications protocol that provides true decentralized messaging, social networking and peer-to-peer business and apps with no middlemen.

Reclaim your digital privacy by deciding exactly which data to share, with whom. Best of all, you can revoke this access at any time. Mercury's profile system replicates and improves on social media functionality. Our location-based network establishes true P2P communication with minimal resources, so it can even run on your phone.

Mercury paves the way for decentralized apps where people are the target, not the product.

Where do you fit in?

True P2P: Connect with anyone, anywhere with no middlemen or censorship.

Optimized: Unlike other peer-to-peer systems, Mercury minimizes connections for use on smart devices.

No central servers: Fully decentralized connection, search, messaging and storage.

True dApps: Fully decentralized apps designed with users as the target, not the product.

Easy-to-use: The Layered architecture provides simple, intuitive app development.
